

Product features and functionalities

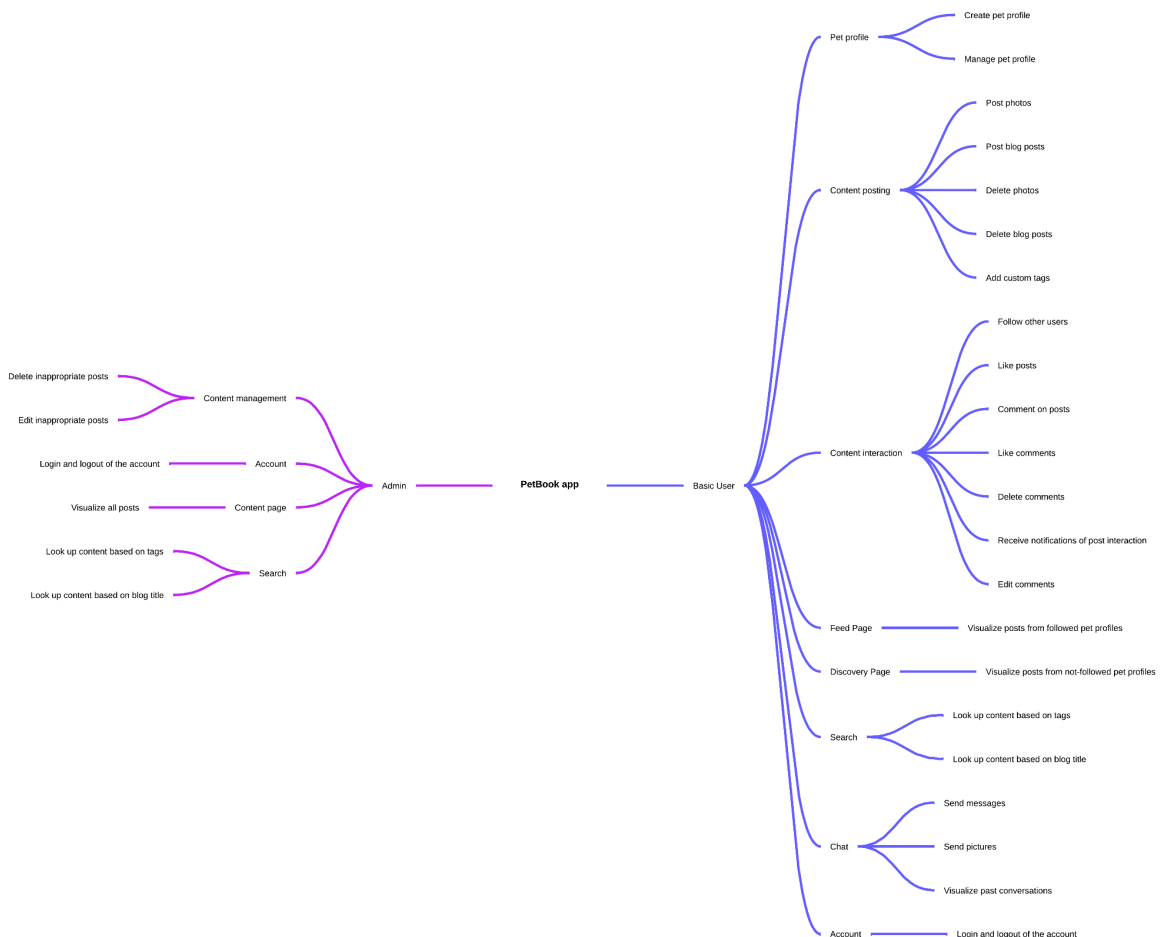

The goal of the PetBook app is to create a community-focused platform. The app should allow users to create profiles for their pets, each pet having its own unique profile. You should be able to post photos of your pet and also interact with other pet profiles by liking and commenting on their posts and following their profiles, similar to other social media apps like Facebook and Instagram. You will have a feed page where you can see what the profiles you follow have posted and also a discovery page where you can see posts made by profiles which you don't follow, in order to interact and engage with new content. There will be a dedicated area where users can share blog posts. Both photos and blog posts should allow for custom tags, which the user can define, this enables other users to efficiently search for posts they are interested in on the platform.

Feature	Functionalities	Implemented from MDS
Pet Profiles	<ul style="list-style-type: none">- create and manage unique pet profile for each pet	Yes
Account	<ul style="list-style-type: none">- create account- login/logout	Yes
Content Posting	<ul style="list-style-type: none">- post photos- post blog posts- delete photos- delete blog posts- add tags to blog post	Yes
Interaction with Content	<ul style="list-style-type: none">- follow other users- like posts- comment on posts- like comments- delete comments- receive notifications of post interaction- edit comments	<ul style="list-style-type: none">- follow other users (No)- like posts (Yes)- comment on posts (Yes)- like comments (Yes)- delete comments (Yes)- receive notifications of post interaction (Yes)- edit comments (Partially)
Feed Page	<ul style="list-style-type: none">- visualize posts from followed pet profiles	No

Tag	- user - inside the blog form	- user, admin - inside the blog card	- user, admin - inside the blog update form	- user, admin - inside the blog update form
Message	- user - chat view	- user - chat view		

- Integration points

We use SQLServer for the database, which communicates with the app through the Entity Framework, which is a Microsoft solution for building a clean, portable, and high-level data access layer.
